

# WATERPROOF WALL PANELS

## TRANSFORM YOUR NASTY BASEMENT WALLS

### A FUNCTIONAL AND COST EFFECTIVE SOLUTION

Once basement walls become wet, they become the perfect place for mold to grow. Because most waterproofing paints are not antimicrobial coatings, they can add to the problem and become a food source for the mold. The DryShield waterproof paneling system will provide you with a bright, clean, semi-finished look, and will help protect your basement from dangerous mold growth. It also helps to direct moisture into a waterproofing channel when installed together.

### WHY DO MY BASEMENT WALLS GET WET?

When the sealant on the outside of the foundation wall breaks down, there will be wet soil laying directly against your block wall. Concrete walls, especially block, will absorb the moisture, allowing water to "wick" through the block. Over time your walls become ugly and discolored. However, if you have active water seepage into your basement, don't rely on wall coatings alone to solve the problem.

## WHY DRY SHIELD?

- 1 4'x8' Sheets of **durable paneling**
- 2 Attached with drilled-in fasteners that are **anchored directly to the wall**
- 3 **Improves the appearance** of basement walls

Redirects water vapor & seepage into a **water control system** that carries it directly to the pump

4

Completely washable and made with inorganic materials that will help **prevent mold growth**
