

The next evolution in basement waterproofing has arrived! The Guardian 2.0 interior waterproofing system captures basement water seepage right where it occurs, the wall/floor/footing joint. Similar on-the-footing waterproofing systems feature weep holes that require water to rise to near floor level before entering the system. Guardian has an open back design that quickly channels water to the sump system. Its ridge and valley corrugated shape allows repoured concrete to engage with the channel for added structural integrity. Corner fittings feature optional inspection ports that can be used to inspect and maintain the system. Each waterproofing channel features a male and female end that help lock the system together. Guardian may be custom ordered in your choice of color.
