

## THE NEXT EVOLUTION IN BASEMENT WATERPROOFING

### SOLVE LEAKY BASEMENT PROBLEMS *FOR GOOD*

The Guardian 2.0 interior waterproofing system captures basement water seepage right where it occurs, the wall/floor/footing joint. Similar on-the-footing waterproofing systems feature weep holes that require water to rise to near floor level before entering the system. Guardian has an open back design that quickly channels water to the sump system.

This reduces the saturating effect, high relative humidity, and musty basement odors.

### WHY IS MY BASEMENT WET?

There are two ways that water can seep into your home, ruining your personal belongings and causing thousands of dollars worth of damage. (1) Water can flow from the base of the wall or (2) Water can rise through cracks in the basement floor. Both situations allow water to build-up around and underneath your home. When this happens, it's just a matter of time until water finds its way in!

## WHY GUARDIAN 2.0?

**1** Open-back design **immediately captures water seepage.**

**2** Channels water to the sump pump system **as quickly as it enters the basement**

**3** Will not **clog or restrict water flow!**

Installation is **less invasive** and requires **little disruption** to the slab

Made in the **USA**

**Reduces the saturating effect**, high relative humidity, and musty basement odors
